The complex plane  $\mathbb{C}$  is the most basic **Riemann surface**. The map  $f(z) = z$  (the identity map) defines a chart for  $\mathbb{C}$ , and  $\{f\}$  is an atlas for  $\mathbb{C}$ . The map  $g(z) = \bar{z}$  (the conjugate map) also defines a chart on  $\mathbb{C}$  and  $\{g\}$  is an atlas for  $\mathbb{C}$ . The charts  $f$  and  $g$  are not compatible, so this endows  $\mathbb{C}$  with two distinct **Riemann surface** structures. In fact, given a **Riemann surface**  $X$  and its atlas  $A$ , the ...
